Abstract

Trigger/selection devices 5 for electronic sound-generating devices, which preferably can be mounted in the working range of a drummer and can be actuated by means of drumsticks, have the disadvantage that they require a considerable amount of space and can only be produced in a very cost-intensive manner. A trigger/selection device is proposed, which consists of at least one pipe which is preferably fastened on a stand and on the casing of which electrically mutually separated switching foils are arranged next to one another in the longitudinal direction, which are surrounded, together with the pipe, by a protective tube (Fig. 1).
